SO YOU HAVE A MICROCHIP SCANNER...

Before you say a dog has no microchip, CHECK YOUR SCANNER.

Not all scanners read all microchips.
Make sure yours is a universal scanner designed to read all microchip types and frequencies.

SCAN CAREFULLY

- Scan slowly, following the scanner's instructions.
- Check the whole body. Chips can move.
- Check batteries and test the scanner.
- If nothing is detected, arrange another scan with a vet, shelter or rescue, ideally using a different universal scanner.

Even universal scanners can miss a chip.

Say "NO MICROCHIP DETECTED" rather than "THIS DOG HAS NO CHIP."

One missed chip could mean one missed chance to get home.
